Title

Conflict detection & resolution tools enhancements through aircraft trajectory information downlinked via ADS-C and optimization factors

Description

Real-time simulation in Italian en-route/approach airspace focussing on the assessment of enhanced conflict detection & resolution aid tools with:

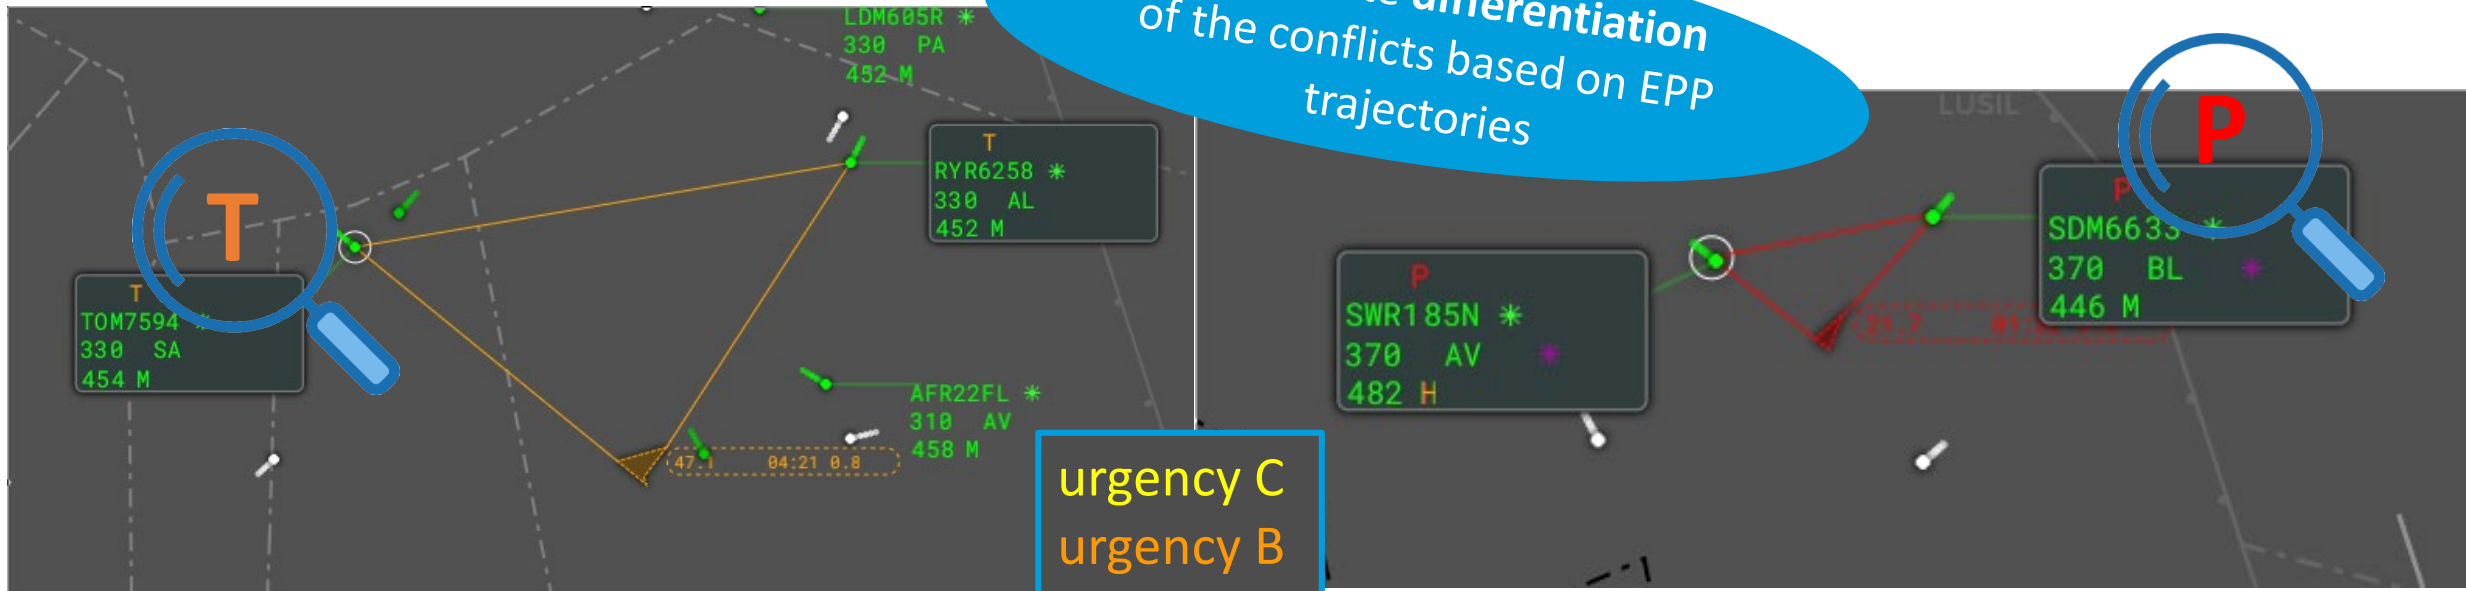

- **detection of tactical conflicts between aircrafts** using Extended Projected Profile (EPP) trajectory information downlinked via ADS-C and with
- **suggestion of tactical conflict resolution advisories** to the controllers optimised with what-next system recommendations based on minimising aircraft fuel-burn and controller workload

40% Traffic ADS-C equipped!

Enhanced Conflict Detection

Baseline behaviour using tactical trajectories to detect conflicts

Enhanced behaviour using EPP trajectories to detect conflicts

Enhanced Conflict Resolution

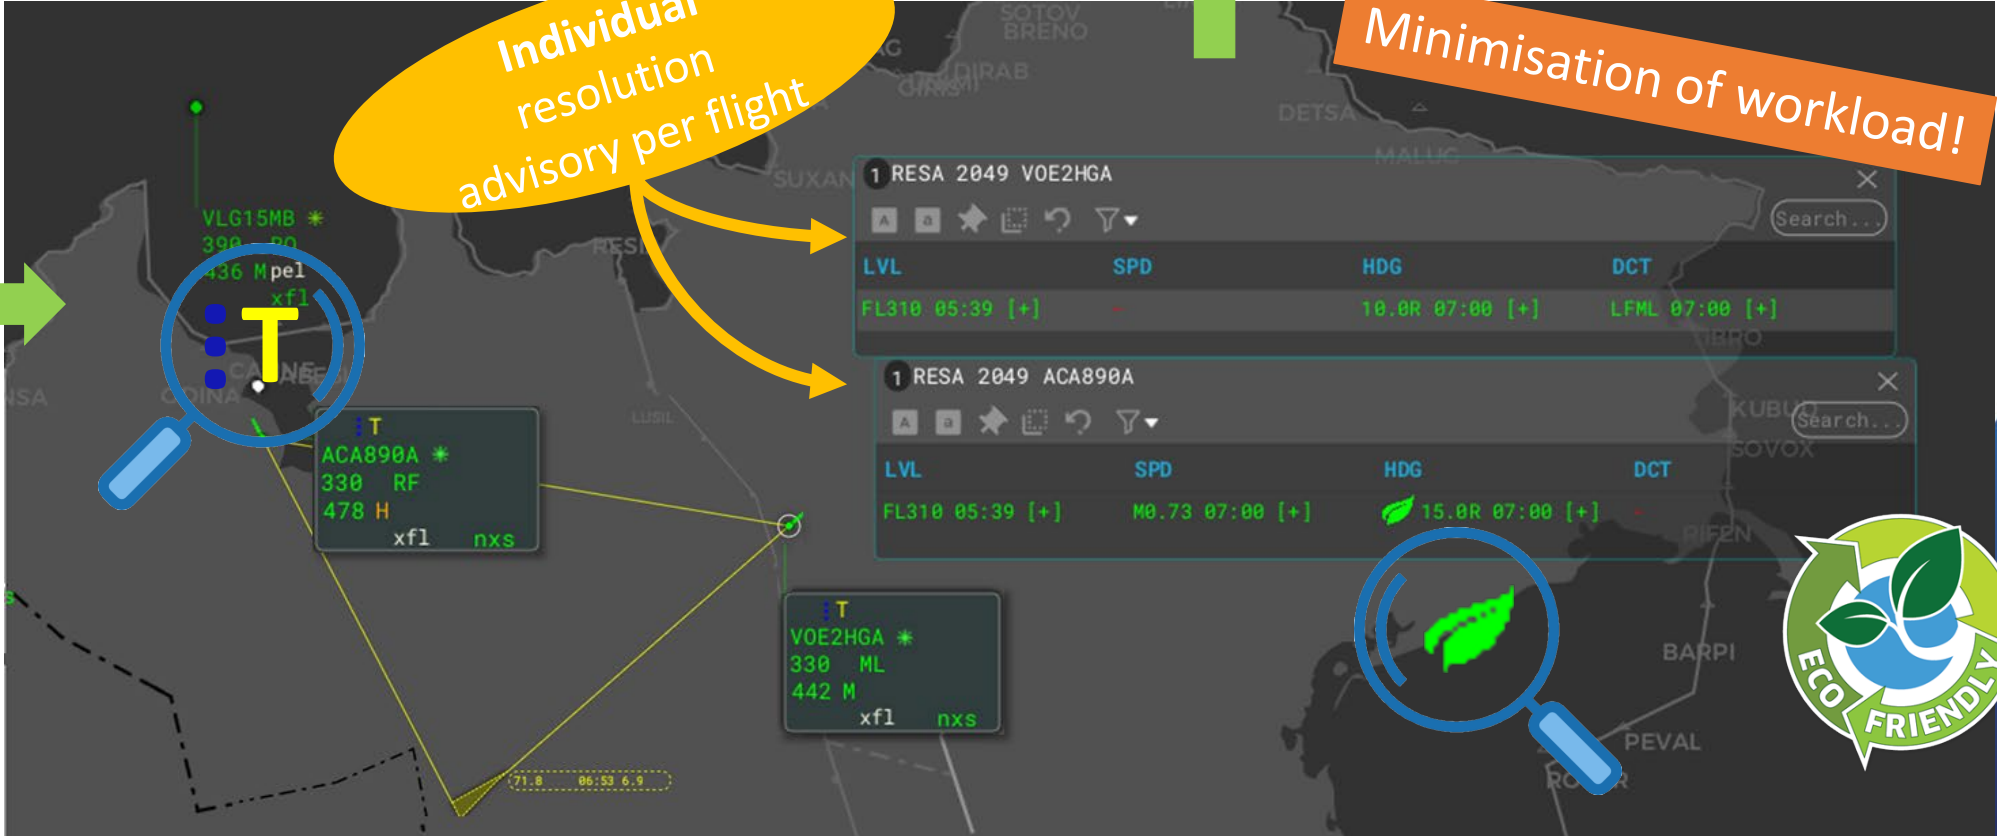

Optimisation factors

On-request **display** of resolution advisories

Minimisation of workload!

Automatic resolution advisories for detected tactical conflicts

Individual resolution advisory per flight
